# Pilot-readiness checklist

From Maintenance Evidence to a Defensible Next Action
A worksheet for maintenance and reliability teams

## One decision worth testing

Asset class / process: _____
Recurring decision: _____
Business owner: _____ Qualified reviewer: _____

[ ] **Scope.** We can describe one recurring decision and why it matters.

[ ] **Evidence.** We know which authorized records support it and how to find the originals.

[ ] **Identity.** We can verify asset identifiers, event dates, and operating context.

[ ] **Exceptions.** We have a way to flag missing, conflicting, or obsolete evidence.

[ ] **Authority.** A qualified person can accept, revise, reject, or request more evidence.

[ ] **Controls.** Existing safety, work-control, and change-approval procedures remain in force.

[ ] **Data.** The relevant owners approve access, transfer, retention, and permitted use.

[ ] **Baseline.** We can measure today's preparation, review, and correction effort.

[ ] **Evaluation.** We can reserve representative cases and record all outcomes, including failures.

[ ] **Decision.** We will agree on continue, revise, and stop criteria before the pilot begins.

## Readiness conversation

An unchecked item is a question to resolve. Do not treat the number of checks as a safety score or permission to deploy. Resolve material data, authority, and safety gaps before live use.

A 30-minute reliability workflow consultation is a scoping conversation about your decision, review process, and potential pilot fit. Use the verified contact route beside the webinar. No confidential records are needed to request the conversation.

# Pilot decision canvas

Complete this with the business owner, qualified reviewers, and data/security owner. This worksheet is a planning aid and does not authorize maintenance or operating changes.

## Decision question

What specific decision should the review packet help someone make?

## Scope and exclusions

Asset family, site/process context, period, and decisions outside the pilot

## Authorized sources

Record types, source owners, access, versions, and transfer method

## Material gaps

Missing or conflicting evidence and the person responsible for resolving it

## Baseline

Comparable cases and current preparation + review + correction effort

# Pilot decision canvas, continued

## Evaluation set

Development cases, reserved test cases, complexity, and reviewer assignments

## Acceptance criteria

Traceability, quality, total effort, exception handling, and agreed thresholds

## Approval path

Who reviews the packet and who authorizes any real action?

## Stop conditions

Data/security breach, unsafe scope, material unsupported claims, or other agreed triggers

## End decision

Continue / revise / stop, evidence required, owner, and review date
